

# How To Sanitize VR Equipment The Right Way

## Wash your hands prior to using VR equipment and wear gloves

You should wash your hands thoroughly before using VR equipment to get rid of harmful germs that could directly contaminate the surfaces of your VR hardware. Hand sanitizer also works, but washing your hands with soap and water is more effective at removing certain germs. Wearing gloves is another option. You should use a fresh pair of gloves when handling equipment and dispose of them after each use.

## Clean devices before and in-between each use with nonabrasive antibacterial wipes

In between each use, you should sanitize your facial interface, nose area, and controllers with lightly-moistened, nonabrasive antibacterial wipes. For the majority of the headset and its controllers, alcohol-free, anti-bacterial wipes will do the job.

Simply wipe down all of the hard surfaces, with particular focus on the areas that are in contact with learners the most. Alcohol wipes shouldn't be used on lenses, but may be used on other headset components.

## Use facial interface covers

One of the biggest harborers of infection are the soft areas of a VR headset, which includes the headband and foam interface found inside. Disposable hygiene covers for universal VR headsets are a good option to keep your headsets internal foam area clean.

These covers are easy to use, moisture absorbent, and quick to install and replace. These hygiene covers are an effective way to ensure that every headset user stays fresh and clean.
